Original endowments

Wealths $(4, 4)$
$x_1^E = (2, 2)$

Redistributed endowments

Wealths $(3, 5)$
$x_1^F = (3/2, 3/2)$

$\omega_1' = (1/2, 5/2)$, $\omega_2' = (7/2, 3/2)$, so $T_1 = -1$ and $T_2 = 1$
Both panels: $p = (1, 1)$, budget slope -1, total resources $(4, 4)$
